Due to the ongoing recent expansion of public interest issues worldwide, the state's right to regulate has been recaptured as a prominent concept in international investment law. The fair and equitable treatment (FET) standard provision in the text of an international investment agreement (IIA) has become a detailed clause clarifying the specific obligations of a state towards an investor under the FET standard. However, striking the right balance between the interests of host states and investors in these new treaty formulations has proved to be challenging. This book greatly clarifies the field by offering the in-depth analysis of the application of the state's right to regulate in relation to FET standard provisions in IIAs and to decisions by arbitral tribunals in FET cases. Recognising that the role of tribunals is to balance the state's public interests and the interests of the investor when interpreting and applying the FET standard, the author pursues such seminal issues and topics as the following: the legitimacy of the objective of the state's measure; obligations and responsibilities of investors towards a host state; the nature and impact of a change to a national regulatory framework; special economic and sociopolitical circumstances in a host state; and due diligence and risk assessment as a condition for the protection of an investor's legitimate expectations. Multiple IIAs concluded by the OECD Member States,

as well by Russia and China between the developing countries, and the prominent investment law cases on the FET standard are examined in detail. The analysis pays particular attention to how investment jurisprudence in FET cases has been reflected in such new IIAs as the Comprehensive Economic and Trade Agreement between the European Union (EU) and Canada (CETA), the EU-Vietnam FTA and the EU-Singapore FTA. These case studies demonstrate the evolution of the IIAs' FET standard provisions and how they balance the application of the FET standard and the state's right to regulate. Suggestions are provided for drafting formulations of the FET standard that can contribute to achieving such a balance. In the clear light it sheds on the legal conditions under which states may regulate in the public interest and its contribution to the reforms that are currently taking place in the field of international investment law, this book constitutes an exemplary framework to evaluate investment decisions on the FET standard and the right to regulate. It is sure to prove extremely useful for practitioners who work on investment cases, policymakers involved in negotiating and drafting of IIAs, policy advisors of governmental and non-governmental organisations and academics in international investment law.

In economics, each and every rational decision made is supposed to maximize individual utility. This approach especially applies to the investor in financial goods. In accordance with neoclassical utility optimization, the individual investors are supposed to be willing to exchange investment good in order to maximize their expected future return. This approach anticipates every individual investor to try and

estimate the future cash flows of the investment in order to evaluate its current value. Hence, trades at every stock exchange are to be executed at all times where you have two investors differing in their estimation of the intrinsic value of an investment product. As a consequence, every investor is supposed to create a portfolio with assets that in turn maximize his/her expected return. Every investor is supposed to make an individual and rational attempt to maximize his/her utility and to behave in a risk-averse manner. However, according to the neoclassical theory, it is not possible to gain more from an investment than the market does, as long as markets are efficient. Financial markets can be seen as the most efficient markets, if not the only efficient markets in real economy, as, in the market context, information is transferred the fastest and prices are thus adopted nearly instantly. Nevertheless, all investors at the stock exchanges try to make money by using their individual knowledge in order to gain something from investing in some assets. They have of course, at the same time, the possibility to follow the market themselves or to try to bet against the market. Every investor hence always faces the question of whether to trade on the market with his/her own individual knowledge in order to gain some additional utility, or to simply attempt to do the same as the whole market and follow the belief of the market at a whole. The question thus arises of what exactly efficient fund management looks like. This paper will discuss several possibilities which arise in literature and in the real economy when thinking about fund management, and will discuss the rather new concept of "Smart Beta" investments, in

particular. The focus of this paper thus lies in the question of whether smart beta concepts serve as potential superior alternatives to the classical passive investment products.

The contribution of research and development to a company's market value has grown considerably in recent years. In the mid-1970s, accountants were able to capture on their ledgers 90-95% of a firm's book value, but by 2000 the importance of intangible assets had grown to the point where they could account for only 13-15%. Financial economists and accountants have investigated the link between a firm's market value and its R&D spending, and various factions advocate a variety of positions on the amount and rate of investment, investors' ability to capture returns on that investment, and ways to

measure value, investment, and returns. 'Tech Stock Valuation' extends the R&D literature by providing detailed direct evidence on the market value implications of inventive and innovative output. Specifically, the book demonstrates that stock-price effects of patent output are most pronounced in the case of high-quality patents, where patent quality is measured by scientific merit. Scientific measures of patent quality give tech stock investors and R&D managers a valuable new tool that can be used to measure R&D program effectiveness. At the same time, it gives investors a new tool to help them assess the value of hard-to-measure intangible assets.

- \*Based on recent research, much of which Dr. Hirschey has pioneered
- \*Gives financial professionals a new tool for assessing R&D quality and its relation to market valuation
