Objective Measures in Cochlear Implants

Labour economics as a discipline has changed dramatically in recent years. Gone are the days of a "job for life". These days, firms and employees are part of a less regulated, more fluid, and more international labour market. Knowledge, training, human resource development and human capital are all major factors on the contemporary scene. This new textbook is the first properly international textbook to reflect these swingeing changes. Its key areas of concentration include: the increasing importance of human capital including education and occupational choice the major subdivision of personnel economics including economic inactivity and absenteeism comparative cross country studies and the impact of globalization and migration on national labour markets equal opportunities and issues of discrimination on the basis of race, gender and disability conflict at work, including both strikes and, uniquely, individual disputes. Other issues explored include the supply and demand of labour, wages, the current role of trade unions, bargaining and conflict, and working time. The book is written in a clear, accessible way with some mathematical exposition, reflecting the text's grounding in current microeconomic theory. The book also contains case studies designed to illuminate theoretical concepts and exercises and discussion questions to test the students understanding of the various concepts outlined in the text.

Demographic Aspects of Migration

Nearly 3% of the world's population no longer live in the country where they were born. George Borjas synthesizes the theories, models, and econometric methods used to identify the causes and consequences of international labor flows, and lays out with clarity a full spectrum of topics with crucial implications for framing debates over immigration.

The Journals of Jacob Gates

This handbook presents a collection of high-quality, authoritative scientific contributions on cross-border migration, written by a carefully selected group of recognized migration experts from around the globe. In recent years, cross-border migration has become an important and intriguing issue, from both a scientific and policy perspective. In the 'age of migration', the volume of cross-border movements of people continues to rise, while the nature of migration flows – in terms of the determinants, length of stay, effects on the sending and host countries, and legal status of migrants – is changing dramatically. Based on a detailed economic-geographical analysis, this handbook studies the motives for cross-border migration, the socio-economic implications for sending countries and regions, the locational choice determinants for cross-border migrants, and the manifold economic-geographic consequences for host countries and regions. Given the complexity of migration decisions and their local or regional impacts, a systematic typology of migrants (motives,

legal status, level of education, gender, age, singles or families, etc.) is provided, together with an assessment of push factors in the place of origin and pull factors at the destination. On the basis of a solid analytical framework and reliable empirical evidence, it examines the impacts of emigration for sending areas and of immigration for receiving areas, and provides a comprehensive discussion of the policy dimensions of cross-border migration.

The Syntax Workbook was written as a response to the students and instructors who, over the years, have requested more problem sets that give greater experience in analyzing syntactic structure. Aligned chapter-by-chapter with Carnie's bestselling textbook, this workbook provides over 120 new exercises on all of the major topics in generative syntax. An all-new workbook to accompany the bestselling syntax textbook, *Syntax: A Generative Introduction*, which answers the need for a practical text in this field. Features over 120 problem sets with answers, designed to give students greater experience of analyzing syntactic structure. Exercises and topics covered includes phrase structure, the lexicon, Case theory, ellipsis, auxiliaries, movement, covert movement, locality conditions, VP shells, and control. Supported by expanded online [title="Carnie Student Companion Site" href="http://bcs.wiley.com/htdocs/Books?action=index&itemId=0470655313&bcslid=7378"](http://bcs.wiley.com/htdocs/Books?action=index&itemId=0470655313&bcslid=7378) student and instructor resources, including

extra chapters on HPSG, LFG and time-saving materials for lecturers, including problem sets, PowerPoint slides, and an instructors' manual. Structured to reflect the style and chapter-by-chapter coverage of the textbook, but its practical, reader-friendly layout also makes it suitable for use as a stand-alone Workbook.

Energy Efficiency in Buildings

Buildings are one of the main causes of the emission of greenhouse gases in the world. Europe alone is responsible for more than 30% of emissions, or about 900 million tons of CO₂ per year. Heating and air conditioning are the main cause of greenhouse gas emissions in buildings. Most buildings currently in use were built with poor energy efficiency criteria or, depending on the country and the date of construction, none at all. Therefore, regardless of whether construction regulations are becoming stricter, the real challenge nowadays is the energy rehabilitation of existing buildings. It is currently a priority to reduce (or, ideally, eliminate) the waste of energy in buildings and, at the same time, supply the necessary energy through renewable sources. The first can be achieved by improving the architectural design, construction methods, and materials used, as well as the efficiency of the facilities and systems; the second can be achieved through the integration of renewable energy (wind, solar, geothermal, etc.) in buildings. In any case, regardless of whether the energy used is renewable or not, the efficiency must always be taken into account. The most profitable and

clean energy is that which is not consumed.

Handbook of the Economics of International Migration

Are immigrants squeezing Americans out of the work force? Or is competition with foreign products imported by the United States an even greater danger to those employed in some industries? How do wages and unions fare in foreign-owned firms? And are the media's claims about the number of illegal immigrants misleading? Prompted by the growing internationalization of the U.S. labor market since the 1970s, contributors to *Immigration, Trade, and the Labor Market* provide an innovative and comprehensive analysis of the labor market impact of the international movements of people, goods, and capital. Their provocative findings are brought into perspective by studies of two other major immigrant-recipient countries, Canada and Australia. The differing experiences of each nation stress the degree to which labor market institutions and economic policies can condition the effect of immigration and trade on economic outcomes. Contributors trace the flow of immigrants by comparing the labor market and migration behavior of individual immigrants, explore the effects of immigration on wages and employment by comparing the composition of the work force in local labor markets, and analyze the impact of trade on labor markets in different industries. A unique data set was developed especially for this study—ranging from an effort to link exports/imports with wages and employment in

manufacturing industries, to a survey of illegal Mexican immigrants in the San Diego area—which will prove enormously valuable for future research.

Modern Labour Economics

Why do critics want to pull up the income tax by its roots? Why do we have an income tax altogether especially if its principles are no longer workable and the tax no longer serves its intended purpose? Or are the roots, in fact, still viable? This compelling book seeks answers to those questions in long-forgotten archives of tax history. Drawing on rare records from Congress, Richard J. Joseph demonstrates how the idea of relating taxes to individuals and businesses evolved during 1893-1895, leading in 1894 to enactment of the first American income tax legislation. That initial law, he notes, was intended to create a permanent and a fair "ability-to-pay" system. With an eye for detail Joseph explores ways in which it would serve as a model for future revenue. He explains how global and domestic changes have rendered it passe'. And he shows how much of that early law despite its swift demise in the case of *Pollock v. The Farmers Loan & Trust Company* informs our current federal taxation system.

Dr. Albert Schmid President of the Federal Office for Migration and Refugees According to the United Nations, about 200 million people of the estimated world population of 6.8 billion are international migrants – that corresponds to about three per cent of the total world population. The proportion of international migrants in the global population has increased only marginally in the last 40 years. But, as a result of global population growth, the absolute number of migrants has increased, and their structure and spatial distribution has changed considerably. A structural shift has taken place primarily in the industrialised countries, where less than 20 per cent of the global workers are now living, but where more than 60 per cent of all migrants worldwide reside. Since 1990, more than 16 million people have moved to Germany, while about 11 million have left the country in the same period. Altogether, 15 million people of international migration origin are living in Germany, comprising almost 19 per cent of Germany's current population of 82 million. At the end of 2006, about 64 million people out of Europe's population of 732 million, or nine per cent, lived in a European country they were not born in. But why does anybody migrate at all? People decide to leave because, in general, they expect to find better conditions and opportunities in other countries or regions.

Volcanoes and eruptions are dramatic surface manifestations of dynamic processes within the Earth, source models over the past three decades. Discovered little more than a decade ago, optogenetics - a revolutionary technique combining genetic and optical methods to observe and control the function of neurons - is now a widely used research tool. Optogenetics-driven research has led to insights into Parkinson's disease and other neurological and psychiatric disorders. With contributions from leaders and innovators from both academia and industry, this volume explores the discovery and application of optogenetics, from the basic science to its potential clinical use. Chapters cover a range of optogenetics applications, including for brain circuits, plasticity, memory, learning, sleep, vision and neurodegenerative and neuropsychiatric diseases. Providing authoritative coverage of the huge potential that optogenetics research carries, this is an ideal resource for researchers and graduate students, as well as for those working in the biotechnology and pharmaceutical industries and in a clinical setting.

and analyzed Reversible Ligand Binding: Theory and Experiment discusses the physical background of protein-ligand interactions—providing a comprehensive view of the various biochemical considerations that govern reversible, as well as irreversible, ligand binding. Special consideration is devoted to enzymology, a field usually treated separately from ligand binding, but actually governed by identical thermodynamic relationships. Attention is given to the design of the experiment, which aids in showing clear evidence of biochemical features that may otherwise escape notice. Classical experiments are reviewed in order to further highlight the importance of the design of the experiment. Overall, the book supplies students with the understanding that is necessary for interpreting ligand binding experiments, formulating plausible reaction schemes, and analyzing the data according to the chosen model(s). Topics covered include: theory of ligand binding to monomeric proteins; practical considerations and commonly encountered problems; oligomeric proteins with multiple binding sites; ligand binding kinetics; hemoglobin and its ligands; single-substrate enzymes and their inhibitors; two-substrate enzymes and their inhibitors; and rapid kinetic methods for studying enzyme reactions. Jacob Gates (9 March 1811 - 14 April 1892) was an early Mormon convert who recorded eyewitness accounts of many significant events in the Latter Day Saint movement's very beginnings. His meticulous notes and journals are housed in the LDS Church History Library in seven handwritten volumes. This book is an edited, annotated, and readable presentation of his collected journals. Also included are other documents related to the time periods covered in these journals, including correspondence, public speeches, legal records, and personal writings. The original manuscript journals are presented in a separate five-part facsimile edition, available as a companion to this edited version.

Unlike most statistical texts, this book breathes real life into multivariate analysis. Starting with a range of actual research examples in the social sciences, it demonstrates how to make the most appropriate choice of technique. The examples are drawn from a broad spectrum of disciplines including: sociology, psychology, economics, political science and international comparative research.

'Sleepwalking to segregation'?

The Economic and Fiscal Consequences of Immigration finds that the long-term impact of immigration on the wages and employment of native-born workers overall is very small, and that any negative impacts are most likely to be found for prior immigrants or native-born high school dropouts. First-generation immigrants are more costly to governments than are the native-born, but the second generation are among the strongest fiscal and economic contributors in the U.S. This report

concludes that immigration has an overall positive impact on long-run economic growth in the U.S. More than 40 million people living in the United States were born in other countries, and almost an equal number have at least one foreign-born parent. Together, the first generation (foreign-born) and second generation (children of the foreign-born) comprise almost one in four Americans. It comes as little surprise, then, that many U.S. residents view immigration as a major policy issue facing the nation. Not only does immigration affect the environment in which everyone lives, learns, and works, but it also interacts with nearly every policy area of concern, from jobs and the economy, education, and health care, to federal, state, and local government budgets. The changing patterns of immigration and the evolving consequences for American society, institutions, and the economy continue to fuel public policy debate that plays out at the national, state, and local levels. The Economic and Fiscal Consequences of Immigration assesses the impact of dynamic immigration processes on economic and fiscal outcomes for the United States, a major destination of world population movements. This report will be a fundamental resource for policy makers and law makers at the federal, state, and local levels but extends to the general public, nongovernmental organizations, the business community, educational institutions, and the research community.

The Economic Geography of Cross-Border Migration

In the context of renewed debates about diversity and cohesion, this book interrogates contemporary claims about race and migration. It demonstrates that many of the claims are myths, presenting evidence in support of and in opposition to them in an accessible yet academically rigorous manner. The book combines an easy-to-read overview of the subject with innovative new research. It tackles head-on questions about levels of immigration, the contribution of immigrants, minority self-segregation, ghettoisation and the future diversity of the population. The authors argue that the myths of race and migration are the real threat to an integrated society and recommend that focus should return to problems of inequality and prejudice.

Internists, surgeons, critical care physicians and nephrologists all treat critically ill patients with renal failure and the multiple system organ dysfunction syndrome. A comprehensive review of the state of the art of this topic is definitely needed both in academic and clinical medicine, and *Critical Care Nephrology* fulfils this need. It is a useful reference tool for both nephrologists and intensive care specialists and it is therefore no coincidence that the editors of the book are themselves specialists in these particular fields. The book addresses the following: definitions of critical illness, epidemiology, monitoring and diagnostic procedures, pathophysiology of organ systems in relation to kidney function, concepts of renal physiologic and pathologic responses to various

derangements, oxygen transport and cardiovascular adaptations, hemodynamic parameters, respiratory parameters, mechanical ventilation and cardiac support, and severity score parameters. The book is also devoted to all forms of acute renal failure with specific reference to intensive care patients. The nature of the multiple organ dysfunction syndrome is discussed with special emphasis on the impact of different organs dysfunction and kidney failure. Kidney function and acute renal failure in patients with kidney, liver and heart transplants is also considered, as well as acute illness occurring in chronic hemodialysis patients. Special emphasis is placed on therapeutic interventions and treatment procedures. Different forms of organ support are discussed including liver, lung and cardiac therapy.

The main theme of this volume of the Yearbook of International Humanitarian Law is weapons law. In several chapters, how International Humanitarian Law (IHL) copes with old and new weapons as well as political developments in regard to military technology is discussed, while in two chapters the significance of non- or less-lethal weapons in peace-keeping and law enforcement operations as well as the legality of lethal autonomous weapon systems under IHL are analysed. Moreover, the volume describes the current status of nuclear deterrence under international law. Another layer is added by

examining how IHL influences the programming of automatic target recognition systems using artificial intelligence. The second part of the book contains a historic perspective on the roots of IHL in Europe, which can be traced back to the ninth century, as well as a Year in Review describing the most important events and legal developments in the area of IHL that took place in 2018. The Yearbook of International Humanitarian Law is the world's only annual publication devoted to the study of the laws governing armed conflict. It provides a truly international forum for high-quality, peer-reviewed academic articles focusing on this crucial branch of international law. Distinguished by contemporary relevance, the Yearbook of International Humanitarian Law bridges the gap between theory and practice and serves as a useful reference tool for scholars, practitioners, military personnel, civil servants, diplomats, human rights workers and students.

Immigration and the Labour Market

The Economics of Immigration is written as a both a reference for researchers and as a textbook on the economics of immigration. It is aimed at two audiences: (1) researchers who are interested in learning more about how economists approach the study of human migration flows; and (2) graduate students taking a course on migration or a labor economics course where immigration is one of the subfields studied. The book covers the economic theory of immigration, which explains why people move across borders and details the consequences of

such movements for the source and destination economies. The book also describes immigration policy, providing both a history of immigration policy in a variety of countries and using the economic theory of immigration to explain the determinants and consequences of the policies. The timing of this book coincides with the emergence of immigration as a major political and economic issue in the USA, Japan Europe and many developing countries.

A review of recent advancements in colloidal nanocrystals and quantum-confined nanostructures, *Nanocrystal Quantum Dots* is the second edition of *Semiconductor and Metal Nanocrystals: Synthesis and Electronic and Optical Properties*, originally published in 2003. This new title reflects the book's altered focus on semiconductor nanocrystals. Gathering contributions from leading researchers, this book contains new chapters on carrier multiplication (generation of multiexcitons by single photons), doping of semiconductor nanocrystals, and applications of nanocrystals in biology. Other updates include: New insights regarding the underlying mechanisms supporting colloidal nanocrystal growth
A revised general overview of multiexciton phenomena, including spectral and dynamical signatures of multiexcitons in transient absorption and photoluminescence
Analysis of nanocrystal-specific features of multiexciton recombination
A review of the status of new field of carrier

multiplication Expanded coverage of theory, covering the regime of high-charge densities New results on quantum dots of lead chalcogenides, with a focus studies of carrier multiplication and the latest results regarding Schottky junction solar cells Presents useful examples to illustrate applications of nanocrystals in biological labeling, imaging, and diagnostics The book also includes a review of recent progress made in biological applications of colloidal nanocrystals, as well as a comparative analysis of the advantages and limitations of techniques for preparing biocompatible quantum dots. The authors summarize the latest developments in the synthesis and understanding of magnetically doped semiconductor nanocrystals, and they present a detailed discussion of issues related to the synthesis, magneto-optics, and photoluminescence of doped colloidal nanocrystals as well. A valuable addition to the pantheon of literature in the field of nanoscience, this book presents pioneering research from experts whose work has led to the numerous advances of the past several years.

The Volume II is entitled “Neurostimulation and pharmacological approaches”. This volume describes augmentation approaches, where improvements in brain functions are achieved by modulation of brain circuits with electrical or optical stimulation, or pharmacological agents. Activation of brain circuits with electrical currents is a conventional approach that includes such methods as (i) intracortical microstimulation (ICMS), (ii) transcranial direct current stimulation (tDCS), and (iii) transcranial magnetic stimulation (TMS). tDCS and TMS are often

regarded as noninvasive methods. Yet, they may induce long-lasting plastic changes in the brain. This is why some authors consider the term “noninvasive” misleading when used to describe these and other techniques, such as stimulation with transcranial lasers. The volume further discusses the potential of neurostimulation as a research tool in the studies of perception, cognition and behavior. Additionally, a notion is expressed that brain augmentation with stimulation cannot be described as a net zero sum proposition, where brain resources are reallocated in such a way that gains in one function are balanced by costs elsewhere. In recent years, optogenetic methods have received an increased attention, and several articles in Volume II cover different aspects of this technique. While new optogenetic methods are being developed, the classical electrical stimulation has already been utilized in many clinically relevant applications, like the vestibular implant and tactile neuroprosthesis that utilizes ICMS. As a peculiar usage of neurostimulation and pharmacological methods, Volume II includes several articles on augmented memory. Memory prostheses are a popular recent development in the stimulation-based BMIs. For example, in a hippocampal memory prosthesis, memory content is extracted from hippocampal activity using a multiple-input, multiple-output non-linear dynamical model. As to the pharmacological approaches to augmenting memory and cognition, the pros and cons of using nootropic drugs are discussed.

The Economic and Fiscal Consequences

of Immigration

Jobs provide higher earnings and better benefits as countries grow, but they are also a driver of development. Poverty falls as people work their way out of hardship and as jobs empowering women lead to greater investments in children. Efficiency increases as workers get better at what they do, as more productive jobs appear, and less productive ones disappear. Societies flourish as jobs bring together people from different ethnic and social backgrounds and provide alternatives to conflict. Jobs are thus more than a byproduct of economic growth. They are transformational —they are what we earn, what we do, and even who we are. High unemployment and unmet job expectations among youth are the most immediate concerns. But in many developing countries, where farming and self-employment are prevalent and safety nets are modest, unemployment rates can be low. In these countries, growth is seldom jobless. Most of their poor work long hours but simply cannot make ends meet. And the violation of basic rights is not uncommon. Therefore, the number of jobs is not all that matters: jobs with high development payoffs are needed. Confronted with these challenges, policy makers ask difficult questions. Should countries build their development strategies around growth, or should they focus on jobs? Can entrepreneurship be fostered, especially among the many microenterprises in developing countries, or are entrepreneurs born? Are greater investments in education and training a prerequisite for

employability, or can skills be built through jobs? In times of major crises and structural shifts, should jobs, not just workers, be protected? And is there a risk that policies supporting job creation in one country will come at the expense of jobs in other countries? The World Development Report 2013: Jobs offers answers to these and other difficult questions by looking at jobs as drivers of development—not as derived labor demand—and by considering all types of jobs—not just formal wage employment. The Report provides a framework that cuts across sectors and shows that the best policy responses vary across countries, depending on their levels of development, endowments, demography, and institutions. Policy fundamentals matter in all cases, as they enable a vibrant private sector, the source of most jobs in the world. Labor policies can help as well, even if they are less critical than is often assumed. Development policies, from making smallholder farming viable to fostering functional cities to engaging in global markets, hold the key to success.

The Economics of Immigration

The economic literature on international migration interests policymakers as well as academics throughout the social sciences. These volumes, the first of a new subseries in the Handbooks in Economics, describe and analyze scholarship created since the inception of serious attention began in the late 1970s. This literature appears in the general economics journals, in various field journals in economics (especially, but not exclusively, those

covering labor market and human resource issues), in interdisciplinary immigration journals, and in papers by economists published in journals associated with history, sociology, political science, demography, and linguistics, among others. Covers a range of topics from labor market outcomes and fiscal consequences to the effects of international migration on the level and distribution of income – and everything in between. Encompasses a wide range of topics related to migration and is multidisciplinary in some aspects, which is crucial on the topic of migration Appeals to a large community of scholars interested in this topic and for whom no overviews or summaries exist

The development of the dialogical approach, the autobiographical perspective and the central role of text-interpretation are all seen as characteristics of post-modern ethnography, arising from the daily chores of field research. The breakthrough into time and history, away from the timeless theorizing of structuralism and functionalism, is seen as inevitable when anthropology is forced to think about its own epistemology. Another current concern is taken up with reflections on the politics of representing the other. In the later essays, he opposes post-modern fashions and re-asserts the need to continue with a truly critical agenda.
