The topic of design is vital to our Army's ability to prevail in the complex, ambiguous environment of the 21st century. Of the many lessons drawn from over seven years of wartime experience, one that stands out prominently is the critical need to improve our ability to exercise the cognitive aspects of battle command - understanding and visualizing. In this era of persistent conflict, we confront challenges that are often illdefined and multifaceted. Where such "hybrid threats" defy convention and easy definition, traditional Cold War planning paradigms alone are insufficient. Design is not a process, but a set of "thinking tools" that complement and reinforce our operations process with a rational, logical approach to an increasingly complex and dynamic operational environment.

In the fifty years since its inception, John Bowlby's attachment theory has been powerfully influential on developmental psychology and, more recently, mental health. Bringing together the experience of a diverse range of mental health practitioners and researchers who routinely use attachment theory in their own work, *Attachment Theory in Adult Mental Health* provides a guide to using attachment theory in everyday practice. Adam N. Danquah and Katherine Berry present a wide-ranging and practical approach to the topic which includes studies on clinical practice, the provision of mental health services and accommodating intercultural perspectives. Section One covers the basics of attachment theory and practice. Section Two presents clinical problems and presentations including, among others, the treatment of depression, anxiety disorders, psychosis, personality disorder and eating disorders. Section Three addresses the needs of specific populations, discussing the influence of sociocultural factors like gender, ethnicity and age. Finally, Section Four examines the organisation and the practitioner, including using the theory to organise services and how individual therapists can integrate their own attachment histories into their approach. Including the most up-to-date theories and practice in the field, *Attachment Theory in Adult Mental Health* is ideal for psychologists and psychological therapists, counsellors, psychiatrists, occupational therapists, social workers and mental health service managers and commissioners.

Abstract : Aim: To evaluate the effect of a manager-required RN competency on staff nurses' perceived knowledge, ability and frequency of information-seeking activities. Background: Basing clinical practice on research and standards of care is

essential to delivering appropriate care with optimal outcomes. Nurses' information-seeking abilities are critical for acquiring evidence-based answers to aid clinical decision-making, yet nurses under-utilize library resources and report barriers. A unit manager sought to test the effect of an innovative competency for acquiring and appraising evidence for practice. Methods: This longitudinal descriptive study evaluated 28 nurses before and after a 1-hr class, as well as 5 months later. The class covered library information services and the basics of critiquing research articles. Results: Nurses had statistically significant improvements in four of five items measuring knowledge/ability and four of five items measuring frequency of information-seeking activities. At 5 months, most knowledge/ability items increased. There was no effect of nurse characteristics on outcomes. Conclusions: A required competency improved nurses' knowledge, ability and frequency of acquiring and appraising evidence with a single 1-hr class and a hands-on practice activity. Unit managers can have great impact on nurses' use of evidence for practice.
